

One packet-order index keeps preview and export aligned

Both paths identify frame i the same way, then decode and render it independently.

Canonical frame identity

Discard negative PTS; sort presentable packets by PTS, then sequence number.

Interactive preview

independent decoder

1 Decode packet i

On a cache miss: preceding keyframe $\rightarrow$ decode forward.

2 Look up metadata at i

Detection for overlays/crop; stabilization[i] for overview.

3 Render the selected view

Overview, or a focused crop from pose anchor + scale.

Focused video export

independent decoder

1 Recover packet index i

Advance in order; use sample PTS to resynchronize if needed.

2 Look up the track at i

Select the closest detection for the requested rider.

3 Render the exported frame

Apply the same focused-crop function: anchor + scale.

Shared: ordered-packet index and focused-crop function · Separate: decoding and output surfaces
